Portfolio

Overview

I enjoy designing mechanisms, testing ideas and making useful things. My work combines mechanical design, small software tools and hands-on prototyping. I am looking for a role where I can contribute to a real engineering project, learn from experienced people and explain the decisions behind my work.

Education

Example University 2023 - 2027
BEng in Mechanical Engineering. Expected graduation: 2027.
Selected study: machine design, materials, control systems and product development.

Technical skills

Design: Parametric CAD, engineering drawings and design reviews.
Making: 3D printing, machining preparation and prototype assembly.
Software: Python, version control and test documentation.
Languages: Add your languages and verified proficiency.

Experience

Example Robotics Studio Jun - Aug 2025
Engineering Intern

- Designed and assembled a fixture for repeatable sensor tests; documented the setup for the engineering team.
- Compared three prototype concepts using assembly time, access and manufacturability as design criteria.
- Recorded test observations and revised the CAD model after design reviews. Replace this with your own verified outcome.

Example Robotics Team 2023 - 2025
Mechanical Lead

- Coordinated the design, manufacture and assembly of a competition robot mechanism.
- Introduced a drawing checklist and build log so new members could follow the design decisions.
- Worked with electrical and software contributors to resolve packaging and maintenance constraints.

Selected projects

Modular Test Platform 2025
Design and prototyping
A small platform for comparing mechanical prototypes using a shared mounting pattern.

- Created CAD assemblies and drawings, printed trial parts and revised the fit after physical checks.
- Published a short design record covering the requirements, alternatives, test method and limitations.

Research and investigation

Low-cost Mechanism Monitoring

Student project / 2024 - 2025

Investigated whether a simple sensor arrangement could identify changes in a repeatable mechanical test.

- Wrote a small data-processing script and compared observations against a documented baseline.
- Reported where the experiment was inconclusive and proposed a more controlled follow-up test.

Additional experience

Community Workshop

Volunteer Mentor / 2024

- Helped beginners turn sketches into simple CAD models and printable parts.
- Prepared practical sessions on safe tool use, measurement and documenting changes.

How I approach a project

Start with the requirement and the constraints. Sketch alternatives, make the simplest useful prototype and record what the test shows. Keep CAD, code and documentation together so another person can understand and continue the work.

Selected recognition

- Example Design Challenge: finalist, 2025.
- Example Engineering Society: project presentation award, 2024.
- Replace these fictional entries with confirmed awards or remove the section.

Portfolio and documentation

Link to a small number of relevant project records. Explain your contribution, include useful drawings or tests and distinguish a team result from your individual work. Avoid confidential files and unsupported performance claims.
